DECISION BRIEF

Example inputs (“We trained, and the numbers went up”), edited. Illustrative, not real data.

Learning and workplace use were measured. Whether they changed, and why, is still open.

Filled: measured (recorded, not proof of cause) · Dashed: assumed · Dotted: unknown · !: reported barrier to verify

→ SUGGESTED NEXT DECISION · FOR LEADERS

Verify the reported barrier with managers and a few participants before deciding to scale, redesign or stop the program.

Rule-based suggestion from your answers. Your judgment decides.

YOU CAN SAY

- Participation was recorded (attendance or completion).
- Participants’ reactions were collected (a satisfaction survey).
- Knowledge or skill was assessed.
- Workplace use was observed or recorded.
- A business metric was tracked.

These confirm which measures exist, not their results. To report a result, add the values and compare them with a baseline or a group that didn’t take part.

YOU CAN’T SAY YET

- Whether knowledge or skill changed. That needs scores compared with a baseline.
- Whether on-the-job behavior changed. That needs a before-and-after or comparison group.
- Whether the metric moved, or why. Tracking a metric doesn’t show its direction or the program’s contribution.
- That the program caused any change. That needs a comparison design and a look at other explanations.

SUGGESTED NEXT EVIDENCE

- **Reported barrier** · to find out whether it is real and how widespread it is: Ask managers and a few participants whether weak manager support limited their use of the skill.
- **Opportunity to apply** · to find out whether people had real chances to apply it: A short work-sampling exercise counting real occasions over two to four weeks.

SKEPTICAL REVIEW · WHAT WOULD MAKE THIS WRONG?

What if weak manager support is the real constraint?

You reported weak manager support. If that’s confirmed, it can limit whether people use what they learned, and more training alone is unlikely to change it. Verify it before you scale, redesign or stop the program.

Rule-based suggestions. They describe which measures exist and what they can support; they don’t report results, predict impact or calculate ROI.
